BIOLOGICAL ENGINEERING

Creatively solve problems involving plants, animals, microorganisms and biological materials. Integrate engineering principals into biological systems to improve environmental quality, produce a value-added product, harvest and process food, or manufacture medical devices.

ABOUT YOUR DEGREE PATH

Biological Engineering majors take courses in biology, chemistry, mathematics, and physics to prepare for more advanced courses in transport processes, bio-based products, bioenergy, biomedical engineering, bioprocessing and sustainability.

Much of your education takes place in labs. Explore water flow, quality and use in the water resources lab and in the field, make discoveries about renewable energy in the advanced biofuel lab, design controls and instruments in the power lab, analyze medical images in the neurophysiology lab, and operate bioreactors in our cell and tissue engineering lab.

Graduates apply their technical expertise to solve problems by designing components, processes and systems. Graduates communicate and work effectively in teams and have adequate knowledge in inorganic/organic chemistry, biochemistry, biological/biomedical science and environmental science.
